Proposed Title: Hi-Vet: E-Commerce Web Application for Household Pets Supplies

Description:

The **Hi-Vet** system is a specialized "Click and Collect" e-commerce platform designed to digitalize and streamline retail operations for pet supplies. By providing a dedicated digital space for pet owners and local businesses, the application bridges the gap between online browsing and physical storefront efficiency through order reservations and inventory management. The system operates through two primary interfaces: a **User/Customer Side** for browsing and loyalty tracking, and an **Admin/Business Side** for data visualization and catalog management.

Objectives:

General Objective: To design and implement an affordable, user-friendly pet supply web application that helps pet owners and local businesses by streamlining order reservations and inventory management.

Specific Objectives:

- **Secure Access:** To create and customize a product catalog for dog and cat supplies featuring secure Google authentication for verified access.
- **Enhanced Navigation:** To integrate filtering by category (food, accessories, vitamins) and advanced search functions to improve user experience.
- **Data Analytics:** To develop a Business Intelligence (BI) dashboard that displays statistics on top-selling products and revenue trends for informed decision-making.
- **Communication:** To implement a notification system via Gmail for automated order confirmations and pickup alerts.

Scope:

The system consists of two primary interfaces with the following functional features:

User Side (Pet Owners):

- **Product Browsing:** Access to a categorized catalog of pet supplies.
- **Reservation System:** Ability to place "Pickup Orders" online for local collection.
- **Loyalty Dashboard:** A personalized interface to track reward points and available vouchers.
- **Automated Alerts:** Gmail notifications for order status and pickup readiness.

Admin/Business Side:

- **Catalog Management:** Tools to update products, categories, and inventory levels.
- **BI Dashboard:** Real-time visualization of sales performance and product trends.
- **Order Management:** Oversight of incoming reservations and pickup fulfillment.

Limitations :

- **Connectivity:** The platform requires a stable internet connection for cloud hosting and Google API integrations.
- **Platform Constraint:** The system is strictly a web-based application; it does not include a native mobile app (iOS/Android).
- **Service Exclusions:** The platform is focused on retail; it excludes veterinary medical services and last-mile delivery logistics.
- **Maintenance:** Requires ongoing monitoring of APIs and cloud database performance.
